

Top Keywords Display and Charting

We use **Ajax** in this tutorial. However, you can use any other techniques to implement the website.

There are many other chart libraries you can use, such as D3.js and Highcharts. We use **Char.js** and draw a bar chart for top keywords.

Development tools

In this class, we use “**VS Code**.” However, you can use PyCharm, Sublime, Atom, Notepad++, vi, vim, or any other favorite editor.

Create a new Django project

Step 1: Create a folder named “site_news_analysis_v1”

```
mkdir website_news_analysis_v1
```

Step 2: Go into the folder “website_news_analysis_v1”

```
cd website_news_analysis_v1
```

Step 3: Create a project configures folder named **website_configs**

`django-admin startproject website_configs .`

A dot here

Runserver

`python manage.py runserver 8000`

Create an APP

Step 1: Please make sure if you are in the folder of “website_news_analysis_v1.” If not, please go into the folder “website_news_analysis_v1”

Step 2: Create an APP named “app_top_keyword”

`django-admin startapp app_top_keyword`

settings.py

settings.py

```
import os

ALLOWED_HOSTS = [] # or '*', 'localhost', '127.0.0.1', "your public ip"

INSTALLED_APPS = [
    .....
    'app_top_keyword',
]

TEMPLATES = [
    {
        'BACKEND': 'django.template.backends.django.DjangoTemplates',
        'DIRS': [os.path.join(BASE_DIR, 'templates')],
        'APP_DIRS': True,
        'OPTIONS': .....
```

```

        .....
        .....
    },
]

```

Notice 1: installed app:

Please make sure the app name should be in the installed app list.

```

INSTALLED_APPS = [
    .....
    'app_top_keyword',
]

```

Django will find your templates (e.g., `home.html`) in the folder of
“`app_top_keyword/templates/`”

Notice 2: templates path:

Django could not find the `base.html`. Why did it happen? Because we did not specify the search path for templates in `setting.py`, Django cannot find our `navbar.html`. How to specify the search path in the `setting.py`?

```

TEMPLATES = [
    {
        'BACKEND': 'django.template.backends.django.DjangoTemplates',
        'DIRS': [os.path.join(BASE_DIR, 'templates')],
        'APP_DIRS': True,
        'OPTIONS': .....
        .....
        .....
    },
]

```

Inside the `TEMPLATES = [...]`, please make sure if the following line exists:

```
'DIRS': [os.path.join(BASE_DIR, 'templates')],
```

Django will also find your HTML files in the following folder:

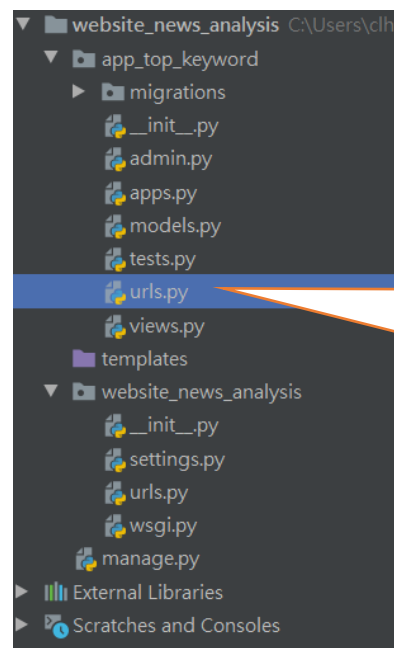

```
websit_news_analysis_v1/templates
```

Create “app_top_keywrod/urls.py”

In folder `app_top_keyword`, create a python file named “`urls.py`”

```
app_top_keywrod/urls.py
```

5

This is the urls.py you created.

```
app_top_keywrod/urls.py
```

```
from django.urls import path
```

```

from app_top_keyword import views

# Declare a namespace for this APP
app_name = 'app_top_keyword'

urlpatterns = [
    # For home
    path("", views.home, name='home'),
    # For Ajax
    # path('api_get_cate_topword/', views.api_get_cate_topword),
]

```

'api_get_cate_topword/'

Notice there is a slash symbol at the end of path string.

Declare a namespace for this APP. The name of namespace is 'app_top_keyword.' We will use the namespace in the future's integrated website.

6

Modify “website_configs/urls.py”

website_configs/urls.py

```

from django.urls import path
from django.urls import include

urlpatterns = [
    # top keywords
    path('topword/', include('app_top_keyword.urls')),
]

```

views.py

```

from django.shortcuts import render
from django.http import JsonResponse
import pandas as pd

# render 渲染網頁
def home(request):
    return render(request, 'app_top_keyword/home.html')

print("app_top_keywords--類別熱門關鍵字載入成功!")

```

完整的 views.py

```

from django.shortcuts import render
from django.http import JsonResponse
import pandas as pd

# render 渲染網頁
def home(request):
    return render(request, 'app_top_keyword/home.html')

# read df
df_topkey =
pd.read_csv('app_top_keyword/dataset/cna_news_topkey_with_category_via_token_pos.csv',
sep=',')

# prepare data
data={}
for idx, row in df_topkey.iterrows():
    data[row['category']] = eval(row['top_keys'])

# We don't use it anymore, so delete it to save memory.
del df_topkey

# POST: csrf_exempt should be used

```

```

# 指定這一支程式忽略 csrf 驗證
from django.views.decorators.csrf import csrf_exempt
@csrf_exempt
def api_get_cate_topword(request):
    cate = request.POST.get('news_category')
    #cate = request.GET['news_category'] # this command also works.
    topk = request.POST.get('topk')
    topk = int(topk)
    print(cate, topk)

    chart_data, wf_pairs = get_category_topword(cate, topk)
    response = {'chart_data': chart_data,
                'wf_pairs': wf_pairs,
                }
    print(response)
    return JsonResponse(response)

def get_category_topword(cate, topk=10):
    wf_pairs = data[cate][0:topk]
    words = [w for w, f in wf_pairs]
    freqs = [f for w, f in wf_pairs]
    chart_data = {
        "category": cate,
        "labels": words,
        "values": freqs}
    return chart_data, wf_pairs

print("app_top_keywords--類別熱門關鍵字載入成功!")

```

HTML (Template)

In the app folder, create a HTML file named “home.html”

app_top_keyword/templates/app_top_keyword/home.html

home.html

```
<!DOCTYPE html>

    // Show default top words bar chart when the page is loaded.

    // Invoke callAjax() after the function is defined, unless callAjax() is defined with "hoisting"

```

```
callAjax();

/**新聞類別選單 select 被選中值有改變時，執行以下事件
$('#cate-selected').on('change', callAjax() );
$("#cate-selected").on("change", function () {

    callAjax();

}); //event function

/**按鈕事件
$("#btn-ok").on("click", function () {

    callAjax();

}); //event function

// ** draw chart using Ajax 畫圖
// There are two ways to define a function:
// one is expression, and the other is definition with "hoisting"
// function with hoisting: function callAjax() {}
// normal function expression: let callAjax = function() {}

// Define callAjax function with hoisting
// callAjax()這樣定義可以在被定義前就被使用 跟我們在 Java 裡面的函數用法一樣!

//let callAjax = function() {
function callAjax() {

    let cate = $("#cate-selected").val();

    //console.log(cate);

    let topk = $("#topk-selected").val();

    //console.log(topk);

/** 產生隨機顏色

function randomColors(num_colors) {
    let colors = [];

    for (i = 0; i < num_colors; i++) {

        let r = Math.floor(Math.random() * 255);
        let g = Math.floor(Math.random() * 255);
        let b = Math.floor(Math.random() * 255);
        let rgb = `rgba(${r},${g},${b},0.5)` // (red, green, blue, alfa) alfa 透明度

        colors.push(rgb);
    }
    return colors;
}

} //show chart function

```

● RGBA Colors

RGBA color values are an extension of RGB color values with an alpha channel - which specifies the opacity of the object.

An RGBA color is specified with the `rgba()` function, which has the following syntax:

`rgba(red, green, blue, alpha)`

The alpha parameter is a number between 0.0 (fully transparent) and 1.0 (fully opaque 不透明).

Make your `api_get_cate_topword` API work!

Put your dataset into the project

You should count your keyword of CNA news in advance and save the top keywords of all categories in the file “`cna_news_topkey_with_category_via_token_pos.csv`”

You can use it in your Django website. Copy your top keywords csv file into folder “dataset” as follows:

`app_top_keyword/dataset/cna_news_topkey_with_category_via_token_pos.csv`

Enable (unmark) your api path

`app_top_keywrod/urls.py`

```
from django.urls import path
from app_top_keyword import views

# Declare a namespace for this APP
app_name = 'app_top_keyword'

urlpatterns = [
    # For home
    path("", views.home, name='home'),
```

```

# For Ajax
path('api_get_cate_topword/', views.api_get_cate_topword),
]

```

Complete your views.py

```

from django.shortcuts import render
from django.http import JsonResponse
import pandas as pd

# render 渲染網頁
def home(request):
    return render(request, 'app_top_keyword/home.html')

# read df
df_topkey =
pd.read_csv('app_top_keyword/dataset/cna_news_topkey_with_category_via_token_pos.csv',
sep=',')

# prepare data
data={}
for idx, row in df_topkey.iterrows():
    data[row['category']] = eval(row['top_keys'])

# We don't use it anymore, so delete it to save memory.
del df_topkey

# POST: csrf_exempt should be used
# 指定這一支程式忽略 csrf 驗證
from django.views.decorators.csrf import csrf_exempt
@csrf_exempt
def api_get_cate_topword(request):
    cate = request.POST.get('news_category')

```

```

#cate = request.POST['news_category'] # this command also works.
topk = request.POST.get('topk')
topk = int(topk)
print(cate, topk)

chart_data, wf_pairs = get_category_topword(cate, topk)
response = {
    'chart_data': chart_data,
    'wf_pairs': wf_pairs,
}
#print(response)
return JsonResponse(response)

def get_category_topword(cate, topk=10):
    wf_pairs = data[cate][0:topk]
    words = [w for w, f in wf_pairs]
    freqs = [f for w, f in wf_pairs]
    chart_data = {
        "category": cate,
        "labels": words,
        "values": freqs}
    return chart_data, wf_pairs

print("app_top_keywords--類別熱門關鍵字載入成功!")

```

Better Structure

base.html

Please create the navbar.html in the folder of “`websit_news_analysis_v1/templates`”.

That is the full path is as follows:

websit_news_analysis_v1/templates/base.html

You have defined the search path of templates file, so Django will automatically find your html files in the websit_news_analysis_v1/templates folder!

home.html

```
{% extends 'base.html' %}

How to define url in Ajax?

43

你的 API 程式開放的 IP? 127.0.0.1

啟動網頁時要使用 <http://127.0.0.1:8000/topword/>

- Call local api service. 呼叫本機端 localhost 的 API 程式
url: "/topword/api_get_cate_topword/",

- 呼叫 <http://127.0.0.1> 的 API 程式
url: "http://127.0.0.1:8000/topword/api_get_cate_topword/",

Why do your page (localhost:8000/topword/) be blocked by CORS policy?

Do not load your page using “localhost:8000/topword/”

Or you your page will be blocked by CORS policy.

```
✖ Access to XMLHttpRequest at 'http://127.0.0.1:8000/topword/api_get_cate_topword/(index):1d/' from origin 'http://localhost:8000' has been blocked by CORS policy: No 'Access-Control-Allow-Origin' header is present on the requested resource.
✖ ▶ POST http://127.0.0.1:8000/topword/api_get_cate_topword/ jquery-3.1.0.min.js:4 net::ERR_FAILED
```

Access to XMLHttpRequest at 'http://127.0.0.1:8000/topword/api_get_cate_topword/' from origin 'http://localhost:8000' has been blocked by CORS policy: No 'Access-Control-Allow-Origin' header is present on the requested resource.

你的 API 服務不接收來自於跨站的請求!! 因為，我們的 Djanog 網站目前還沒設定允許 CORS，日後會再介紹!
